Row-Echelon Matrix

Definition

A matrix is called a row-echelon matrix if

- ▶ All rows consisting entirely of zeros are at the bottom.
- ► The first nonzero entry in each nonzero row is a 1 (called the leading 1 for that row).
- ► Each leading 1 is to the right of all leading 1's in rows above it.

A matrix is said to be in the row-echelon form (REF) if it a row-echelon matrix.

Example

where * can be any number.

Definition

A matrix is called a reduced row-echelon matrix if

- ► Row-echelon matrix.
- Each leading 1 is the only nonzero entry in its column.

A matrix is said to be in the reduced row-echelon form (RREF) if it a reduced row-echelon matrix.

Solution (continued)

Given the reduced row-echelon matrix

$$\left[\begin{array}{ccc|c}
1 & 0 & 7/3 & 2/3 \\
0 & 1 & -5/3 & -1/3 \\
0 & 0 & 0 & 0
\end{array} \right]$$

$$x = \frac{2}{3} - \frac{7}{3}s$$

$$y = -\frac{1}{3} + \frac{5}{3}s$$

$$z = s$$

 $z = \frac{b - 2 - 3c}{2 - 2}$

 $x = 1 + 3c - 4\left(\frac{b - 2 - 3c}{a - 2}\right)$

 $y = -c + 2\left(\frac{b - 2 - 3c}{a - 2}\right)$

Case 2. If a = 2, then the augmented matrix becomes

From this we see that the system has no solutions when $b - 2 - 3c \neq 0$.

Case 2. If a = 2, then the augmented matrix becomes

$$\begin{bmatrix} 1 & 0 & 4 & | & 1+3c \\ 0 & 1 & -2 & | & -c \\ 0 & 0 & a-2 & b-2-3c \end{bmatrix} \rightarrow \begin{bmatrix} 1 & 0 & 4 & | & 1+3c \\ 0 & 1 & -2 & | & -c \\ 0 & 0 & 0 & | & b-2-3c \end{bmatrix}$$

From this we see that the system has no solutions when $b - 2 - 3c \neq 0$.

Finally when a=2 and b-3c=2, the augmented matrix becomes

Finally when a = 2 and b - 3c = 2, the augmented matrix becomes

and the system has infinitely many solutions.

Finally when a = 2 and b - 3c = 2, the augmented matrix becomes

Rank

Definition

The rank of a matrix A, denoted rank A, is the number of leading 1's in any row-echelon matrix obtained from A by performing elementary row operations.

r leading 1's

Find the rank of
$$A = \begin{bmatrix} a & b & 5 \\ 1 & -2 & 1 \end{bmatrix}$$
.

Find the rank of
$$A = \begin{bmatrix} a & b & 5 \\ 1 & -2 & 1 \end{bmatrix}$$
.

Solution

Find the rank of $A = \begin{bmatrix} a & b & 5 \\ 1 & -2 & 1 \end{bmatrix}$.

Otherwise, rank A = 2.

Solution

$$\begin{bmatrix} \mathbf{a} & \mathbf{b} & \mathbf{5} \\ \mathbf{1} & -2 & \mathbf{1} \end{bmatrix} \rightarrow \begin{bmatrix} \mathbf{1} & -2 & \mathbf{1} \\ \mathbf{a} & \mathbf{b} & \mathbf{5} \end{bmatrix} \rightarrow \begin{bmatrix} \mathbf{1} & -2 & \mathbf{1} \\ \mathbf{0} & \mathbf{b} + 2\mathbf{a} & \mathbf{5} - \mathbf{a} \end{bmatrix}$$

If b + 2a = 0 and 5 - a = 0, i.e., a = 5 and b = -10, then rank A = 1.

For any system of linear equations, exactly one of the following holds:

One can see what case applies by looking at the RREF matrix equivalent to the augmented matrix of the system and distinguishing three cases:

- 1. The last nonzero row is $[0, \dots, 0, 1]$: no solution.
- 2. The last nonzero row is **not** $[0, \dots, 0, 1]$ and all variables are leading: unique solution.
- 3. The last nonzero row is **not** $[0, \dots, 0, 1]$ and there are non-leading variables: infinitely many solutions.

This row-echelon matrix corresponds to the system

$$x + 0y + \frac{7}{3}z = -\frac{2}{3}$$

 $y - \frac{5}{3}z = -\frac{1}{3}$

This row-echelon matrix corresponds to the system

$$x + 0y + \frac{7}{3}z = -\frac{2}{3}$$

 $y - \frac{5}{3}z = -\frac{1}{3}$

and thus

$$x = \frac{2}{3} - \frac{7}{3}z$$
 $y = -\frac{1}{3} + \frac{5}{3}z$

This row-echelon matrix corresponds to the system

$$x + 0y + \frac{7}{3}z = -\frac{2}{3}$$

 $y - \frac{5}{3}z = -\frac{1}{3}$

and thus

$$x = \frac{1}{3} - \frac{1}{3}z$$

$$y = -\frac{1}{3} + \frac{5}{3}z$$

Setting z = s, where $s \in \mathbb{R}$, gives us (as before):

$$x = \frac{2}{3} - \frac{7}{3}s$$

$$y = -\frac{1}{3} + \frac{5}{3}s$$

$$z = s$$

This row-echelon matrix corresponds to the system

$$x + 0y + \frac{7}{3}z = -\frac{2}{3}$$

 $y - \frac{5}{3}z = -\frac{1}{3}$

and thus

$$x = \frac{2}{3} - \frac{7}{3}z$$
$$y = -\frac{1}{3} + \frac{5}{3}z$$

Setting z = s, where $s \in \mathbb{R}$, gives us (as before):

$$x = \frac{2}{3} - \frac{7}{3}s$$

$$y = -\frac{1}{3} + \frac{5}{3}s$$

$$z = s$$

Derive the formula for $1^r + 2^r + \cdots + n^r$ for r = 3.

Problem

Derive the formula for $1^r + 2^r + \cdots + n^r$ for r = 3.

Solution

We know that $1^3 + 2^3 + \cdots + n^3$ is a polynomial in n of oder 4, namely,

$$1^3 + 2^3 + \dots + n^3 = a_0 + a_1 n + a_2 n^2 + a_3 n^3 + a_4 n^4.$$

Problem

Derive the formula for $1^r + 2^r + \cdots + n^r$ for r = 3.

Solution

We know that $1^3 + 2^3 + \cdots + n^3$ is a polynomial in n of oder 4, namely,

$$1^3 + 2^3 + \dots + n^3 = a_0 + a_1 n + a_2 n^2 + a_3 n^3 + a_4 n^4.$$

It is easy to see that when n=0, both sides should be equal to zero. Hence, $a_0=0$.

Problem

Derive the formula for $1^r + 2^r + \cdots + n^r$ for r = 3.

Solution

We know that $1^3 + 2^3 + \cdots + n^3$ is a polynomial in n of oder 4, namely,

$$1^3 + 2^3 + \dots + n^3 = a_0 + a_1 n + a_2 n^2 + a_3 n^3 + a_4 n^4.$$

It is easy to see that when n=0, both sides should be equal to zero. Hence, $a_0=0$. Now we have 4 unknowns, a_1, \dots, a_4 . We can let $n=1, \dots, 4$ to form 4 equations in order to find these unknowns:

Hence, we have the following augmented matrix:

$$\left(\begin{array}{cccc|ccc}
1 & 1 & 1 & 1 & 1 \\
2 & 4 & 8 & 16 & 9 \\
3 & 9 & 27 & 81 & 36 \\
4 & 16 & 64 & 256 & 100
\end{array}\right)$$

Hence, we have the following augmented matrix:

$$\left(\begin{array}{ccc|ccc|ccc}1 & 1 & 1 & 1 & 1\\2 & 4 & 8 & 16 & 9\\3 & 9 & 27 & 81 & 36\\4 & 16 & 64 & 256 & 100\end{array}\right)$$

You can use Octave or Matlab to compute the reduced echelon form:

$$\left(\begin{array}{ccc|ccc|c} 1 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 1/4 \\ 0 & 0 & 1 & 0 & 1/2 \\ 0 & 0 & 0 & 1 & 1/4 \end{array}\right)$$

Hence, we have the following augmented matrix:

$$\left(\begin{array}{ccccccc}
1 & 1 & 1 & 1 & 1 \\
2 & 4 & 8 & 16 & 9 \\
3 & 9 & 27 & 81 & 36 \\
4 & 16 & 64 & 256 & 100
\end{array}\right)$$

You can use Octave or Matlab to compute the reduced echelon form:

$$\left(\begin{array}{ccc|ccc|c} 1 & 0 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 & 1/4 \\ 0 & 0 & 1 & 0 & 1/2 \\ 0 & 0 & 0 & 1 & 1/4 \end{array}\right)$$

Therefore, we have that

$$1^3 + 2^3 + \dots + n^3 = \frac{n^2}{4} + \frac{n^3}{2} + \frac{n^4}{4} = \frac{1}{4}n^2(n+1)^2.$$
