The Identity and Inverse Matrices

Definition

For each $n \geq 2$, the $n \times n$ identity matrix, denoted I_n , is the matrix having ones on its main diagonal and zeros elsewhere, and is defined for all $n \geq 2$.

Example

$$I_2 = \left[\begin{array}{cc} 1 & 0 \\ 0 & 1 \end{array} \right], \qquad I_3 = \left[\begin{array}{ccc} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{array} \right]$$

Definition

Let $n \geq 2$. For each $j, 1 \leq j \leq n$, we denote by \vec{e}_j the $j^{\mbox{th}}$ column of I_n .

Example

When
$$n = 3$$
, $\vec{e}_1 = \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix}$, $\vec{e}_2 = \begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}$, $\vec{e}_3 = \begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}$.

Theorem

Let A be an $m \times n$ matrix. Then $AI_n = A$ and $I_m A = A$.

Proof.

The (i,j)-entry of AI_n is the product of the i^{th} row of $A=[a_{ij}]$, namely $\left[\begin{array}{ccc} a_{i1} & a_{i2} & \cdots & a_{ij} & \cdots & a_{in} \end{array}\right]$ with the j^{th} column of I_n , namely \vec{e}_j . Since \vec{e}_j has a one in row j and zeros elsewhere,

$$\left[\begin{array}{cccc} a_{i1} & a_{i2} & \cdots & a_{ij} & \cdots & a_{in} \end{array}\right] \vec{e}_j = a_{ij}$$

Since this is true for all $i \le m$ and all $j \le n$, $AI_n = A$.

The proof of $I_m A = A$ is analogous—work it out!

Instead of AI_n and I_mA we often write AI and IA, respectively, since the size of the identity matrix is clear from the context: the sizes of A and I must be compatible for matrix multiplication.

Thus

$$AI = A$$
 and $IA = A$

which is why I is called an identity matrix – it is an identity for matrix multiplication.

Definition (Matrix Inverses)

Let A be an $n \times n$ matrix. Then B is an inverse of A if and only if $AB = I_n$ and $BA = I_n$.

Remark

Note that since A and I_n are both $n \times n$, B must also be an $n \times n$ matrix.

Example

Let
$$A = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$$
 and $B = \begin{bmatrix} -2 & 1 \\ 3/2 & -1/2 \end{bmatrix}$. Then
$$AB = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \quad \text{and} \quad BA = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

Therefore, B is an inverse of A.

Problem

Does every square matrix have an inverse?

Solution

No! Take e.g. the zero matrix O_n (all entries of O_n are equal to 0)

$$AO_n = O_nA = O_n$$

for all $n\times n$ matrices A: The (i, j)-entry of \mathbf{O}_nA is equal to $\sum_{k=1}^n \mathbf{0}a_{kj}=0.$ \blacksquare

Problem

Does every nonzero square matrix have an inverse?

Problem

Does the following matrix A have an inverse?

$$\mathbf{A} = \left[\begin{array}{cc} 0 & 1 \\ 0 & 1 \end{array} \right]$$

Solution

No! To see this, suppose

$$B = \left[\begin{array}{cc} a & b \\ c & d \end{array} \right]$$

is an inverse of A. Then

$$AB = \begin{bmatrix} 0 & 1 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} a & b \\ c & d \end{bmatrix} = \begin{bmatrix} c & d \\ c & d \end{bmatrix}$$

which is never equal to I₂. (Why?)

Theorem (Uniqueness of an Inverse)

If A is a square matrix and B and C are inverses of A, then B=C.

Proof.

Since B and C are inverses of A, AB = I = BA and AC = I = CA. Then

$$C = CI = C(AB) = CAB$$

and

$$B = IB = (CA)B = CAB$$

so B = C.

Example (revisited)

Ear
$$\Lambda = \begin{bmatrix} 1 & 2 \end{bmatrix}$$

For $A = \begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$ and $B = \begin{bmatrix} -2 & 1 \\ 3/2 & -1/2 \end{bmatrix}$, we saw that $AB = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} \quad \text{and} \quad BA = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$

The preceding theorem tells us that B is the inverse of A, rather than just an inverse of A.

Remark (notation)

Let A be a square matrix, i.e., an $n \times n$ matrix.

The inverse of A, if it exists, is denoted A^{-1} , and

$$AA^{-1} = I = A^{-1}A$$

▶ If A has an inverse, then we say that A is invertible.

The Identity and Inverse Matrices

Finding the Inverse of a Matrix

Properties of the Inverse

Inverse of Transformations

Finding the inverse of a 2×2 matrix

Example

Suppose that $A = \begin{bmatrix} a & b \\ c & d \end{bmatrix}$. If $ad - bc \neq 0$, then there is a formula for A^{-1} :

$$A^{-1} = \frac{1}{ad - bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix}.$$

This can easily be verified by computing the products AA^{-1} and $A^{-1}A$.

$$AA^{-1} = \begin{bmatrix} a & b \\ c & d \end{bmatrix} \frac{1}{ad - bc} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix}$$
$$= \frac{1}{ad - bc} \left(\begin{bmatrix} a & b \\ c & d \end{bmatrix} \begin{bmatrix} d & -b \\ -c & a \end{bmatrix} \right)$$
$$= \frac{1}{ad - bc} \begin{bmatrix} ad - bc & 0 \\ 0 & -bc + ad \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix}$$

Showing that $A^{-1}A = I_2$ is left as an exercise.

Remark

Here are some terminology related to this example:

1. Determinant:

$$\det \begin{pmatrix} a & b \\ c & d \end{pmatrix} := ad - cd$$

2. Adjugate:

$$\operatorname{adj} \begin{pmatrix} a & b \\ c & d \end{pmatrix} := \begin{pmatrix} d & -b \\ -c & a \end{pmatrix}$$

Problem

Suppose that A is any $n \times n$ matrix.

- \blacktriangleright How do we know whether or not A^{-1} exists?
- ▶ If A^{-1} exists, how do we find it?

Solution

The matrix inversion algorithm!

Although the formula for the inverse of a 2×2 matrix is quicker and easier to use than the matrix inversion algorithm, the general formula for the inverse an $n \times n$ matrix, $n \ge 3$ (which we will see later), is more complicated and difficult to use than the matrix inversion algorithm. To find inverses of square matrices that are not 2×2 , the matrix inversion algorithm is the most efficient method to use.

The Matrix Inversion Algorithm

Let A be an $n \times n$ matrix. To find A^{-1} , if it exists,

Step 1 take the $n \times 2n$ matrix

$$[A \mid I_n]$$

obtained by augmenting A with the $n\times n$ identity matrix, $I_{\rm n}.$

Step 2 Perform elementary row operations to transform [A | I_n] into a reduced row-echelon matrix.

Theorem (Matrix Inverses)

Let A be an $n \times n$ matrix. Then the following conditions are equivalent.

- 1. A is invertible.
- 2. the reduced row-echelon form on A is I.
- 3. [A | I_n] can be transformed into [I_n | A^{-1}] using the Matrix Inversion Algorithm.

Problem

Find, if possible, the inverse of
$$\begin{bmatrix} 1 & 0 & -1 \\ -2 & 1 & 3 \\ -1 & 1 & 2 \end{bmatrix}$$
.

Solution

Using the matrix inversion algorithm

$$\begin{bmatrix} 1 & 0 & -1 & 1 & 0 & 0 \\ -2 & 1 & 3 & 0 & 1 & 0 \\ -1 & 1 & 2 & 0 & 0 & 1 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & 0 & -1 & 1 & 0 & 0 \\ 0 & 1 & 1 & 2 & 1 & 0 \\ 0 & 1 & 1 & 1 & 0 & 1 \end{bmatrix} \rightarrow \begin{bmatrix} 1 & 0 & -1 & 1 & 0 & 0 \\ 0 & 1 & 1 & 1 & 0 & 1 \end{bmatrix}$$

From this, we see that A has no inverse.

Problem

Problei

Let $A = \begin{bmatrix} 3 & 1 & 2 \\ 1 & -1 & 3 \\ 1 & 2 & 4 \end{bmatrix}$. Find the inverse of A, if it exists.

Solution

Using the matrix inversion algorithm

$$\rightarrow \left[\begin{array}{ccc|ccc|c} 1 & -1 & 3 & 0 & 1 & 0 \\ 0 & 4 & -7 & 1 & -3 & 0 \\ 0 & 3 & 1 & 0 & -1 & 1 \end{array} \right] \rightarrow \left[\begin{array}{ccc|ccc|c} 1 & -1 & 3 & 0 & 1 & 0 \\ 0 & 1 & -8 & 1 & -2 & -1 \\ 0 & 3 & 1 & 0 & -1 & 1 \end{array} \right]$$

$$\rightarrow \left[\begin{array}{cc|cc|c} 1 & 0 & -5 & 1 & -1 & -1 \\ 0 & 1 & -8 & 1 & -2 & -1 \\ 0 & 0 & 25 & -3 & 5 & 4 \end{array} \right] \rightarrow \left[\begin{array}{cc|cc|c} 1 & 0 & -5 & 1 & -1 & -1 \\ 0 & 1 & -8 & 1 & -2 & -1 \\ 0 & 0 & 1 & -\frac{3}{25} & \frac{5}{25} & \frac{4}{25} \end{array} \right]$$

$$\rightarrow \left[\begin{array}{ccc|c} 1 & 0 & 0 & \frac{10}{25} & 0 & -\frac{5}{25} \\ 0 & 1 & 0 & \frac{1}{25} & -\frac{10}{25} & \frac{7}{25} \\ 0 & 0 & 1 & -\frac{3}{25} & \frac{5}{25} & \frac{4}{25} \end{array} \right] = \left[\begin{array}{ccc|c} I & A^{-1} \end{array} \right]$$

Solution (continued)

Therefore, A^{-1} exists, and

$$A^{-1} = \begin{bmatrix} \frac{10}{25} & 0 & -\frac{5}{25} \\ \frac{1}{25} & -\frac{10}{25} & \frac{7}{25} \\ -\frac{3}{25} & \frac{5}{25} & \frac{4}{25} \end{bmatrix} = \frac{1}{25} \begin{bmatrix} 10 & 0 & -5 \\ 1 & -10 & 7 \\ -3 & 5 & 4 \end{bmatrix}.$$

Remark

It is always a good habit to check your answer by computing AA^{-1} and $A^{-1}A$.

One can use matrix inverse to solve $A\vec{x} = \vec{b}$ when there are n linear equations in n variables, i.e., A is a square matrix.

Example

The system of linear equations

$$2x - 7y = 3$$
$$5x - 18y = 8$$

can be written in matrix form as $A\vec{x} = \vec{b}$:

$$\left[\begin{array}{cc} 2 & -7 \\ 5 & -18 \end{array}\right] \left[\begin{array}{c} \mathbf{x} \\ \mathbf{y} \end{array}\right] = \left[\begin{array}{c} 3 \\ 8 \end{array}\right]$$

You can check that
$$A^{-1} = \begin{bmatrix} 18 & -7 \\ 5 & -2 \end{bmatrix}$$
.

Example (continued)

Since A^{-1} exists and has the property that $A^{-1}A = I$, we obtain the following.

$$A\vec{x} = \vec{b}$$

$$A^{-1}(A\vec{x}) = A^{-1}\vec{b}$$

$$(A^{-1}A)\vec{x} = A^{-1}\vec{b}$$

$$I\vec{x} = A^{-1}\vec{b}$$

$$\vec{x} = A^{-1}\vec{b}$$

i.e., $A\vec{x} = \vec{b}$ has the unique solution given by $\vec{x} = A^{-1}\vec{b}$. Therefore,

$$\vec{\mathbf{x}} = \mathbf{A}^{-1} \begin{bmatrix} 3 \\ 8 \end{bmatrix} = \begin{bmatrix} 18 & -7 \\ 5 & -2 \end{bmatrix} \begin{bmatrix} 3 \\ 8 \end{bmatrix} = \begin{bmatrix} -2 \\ -1 \end{bmatrix}$$

is the unique solution to the system.

Remark

The last example illustrates another method for solving a system of linear equations when the coefficient matrix is square and invertible. Unless that coefficient matrix is 2×2 , this is generally NOT an efficient method for solving a system of linear equations.

Example

Let A, B and C be matrices, and suppose that A is invertible.

1. If AB = AC, then

$$A^{-1}(AB) = A^{-1}(AC)$$

$$(A^{-1}A)B = (A^{-1}A)C$$

$$IB = IC$$

$$B = C$$

2. If BA = CA, then

$$(BA)A^{-1} = (CA)A^{-1}$$

$$B(AA^{-1}) = C(AA^{-1})$$

$$BI = CI$$

$$B = C$$

Problem

Can you find square matrices A, B and C for which AB = AC but $B \neq C$?

Copyright

The Identity and Inverse Matrices

Finding the Inverse of a Matrix

Properties of the Inverse

Inverse of Transformations

Properties of the Inverse

Example

Suppose A is an invertible matrix. What is the $(A^T)^{-1}$? We need to find:

$$A^{T} \boxed{???} = \boxed{???} A^{T} = I.$$

Notice that

$$A^{T}(A^{-1})^{T} = (A^{-1}A)^{T} = I^{T} = I$$

and

$$(\boldsymbol{A}^{-1})^{\mathrm{T}}\boldsymbol{A}^{\mathrm{T}} = (\boldsymbol{A}\boldsymbol{A}^{-1})^{\mathrm{T}} = \boldsymbol{I}^{\mathrm{T}} = \boldsymbol{I}$$

Hence,
$$\boxed{???} = (A^{-1})^{T}$$
, i.e., $(A^{T})^{-1} = (A^{-1})^{T}$.

Properties of the Inverse

Example

Suppose A and B are invertible $n \times n$ matrices. What is $(AB)^{-1}$?

We need to find:

$$(AB) \boxed{???} = \boxed{???} (AB) = I.$$

Notice that

$$(AB)(B^{-1}A^{-1}) = A(BB^{-1})A^{-1} = AIA^{-1} = AA^{-1} = I$$

and

$$(B^{-1}A^{-1})(AB) = B^{-1}(A^{-1}A)B = B^{-1}IB = B^{-1}B = I$$

Hence,
$$???$$
 = $B^{-1}A^{-1}$, i.e., $(AB)^{-1} = B^{-1}A^{-1}$.

The previous two examples prove the first two parts of the following theorem.

Theorem (Properties of Inverses)

- 1. If A is an invertible matrix, then $(A^T)^{-1} = (A^{-1})^T$.
- 2. If A and B are invertible matrices, then AB is invertible and

$$(AB)^{-1} = B^{-1}A^{-1}$$
.

3. If A_1, A_2, \ldots, A_k are invertible, then $A_1 \overline{A_2 \cdots A_k}$ is invertible and

$$(A_1A_2\cdots A_k)^{-1}=A_k^{-1}A_{k-1}^{-1}\cdots A_2^{-1}A_1^{-1}.$$

Theorem (More Properties of Inverses)

1. I is invertible, and
$$I^{-1} = I$$
.

- 2. If A is invertible, so is A^{-1} , and $(A^{-1})^{-1} = A$.
- 3. If A is invertible, so is A^k , and $(A^k)^{-1} = (A^{-1})^k$.
- (A^k means A multiplied by itself k times) 4. If A is invertible and $p \in \mathbb{R}$ is nonzero, then pA is invertible, and $(pA)^{-1} = \frac{1}{p}A^{-1}$.

Example

Given $(3I - A^T)^{-1} = 2\begin{bmatrix} 1 & 1 \\ 2 & 3 \end{bmatrix}$, we wish to find the matrix A. Taking

inverses of both sides of the equation:
$$3I - A^{T} = \begin{pmatrix} 2 & 1 & 1 \\ 2 & 3 \end{pmatrix} \end{pmatrix}^{-1}$$
$$= \begin{pmatrix} 1 & 1 & 1 \end{pmatrix}^{-1}$$

$$= \begin{array}{ccc} 2 \begin{bmatrix} 2 & 3 \end{bmatrix} \\ = \begin{array}{ccc} \frac{1}{2} \begin{bmatrix} 3 & -1 \\ -2 & 1 \end{bmatrix} \\ & \begin{bmatrix} \frac{3}{2} & -\frac{1}{2} \end{bmatrix} \end{array}$$

Example (continued)

$$3I - A^{T} = \begin{bmatrix} \frac{3}{2} & -\frac{1}{2} \\ -1 & \frac{1}{2} \end{bmatrix}$$

$$-A^{T} = \begin{bmatrix} \frac{3}{2} & -\frac{1}{2} \\ -1 & \frac{1}{2} \end{bmatrix} - 3I$$

$$-A^{T} = \begin{bmatrix} \frac{3}{2} & -\frac{1}{2} \\ -1 & \frac{1}{2} \end{bmatrix} - \begin{bmatrix} 3 & 0 \\ 0 & 3 \end{bmatrix}$$

$$-A^{T} = \begin{bmatrix} -\frac{3}{2} & -\frac{1}{2} \\ -1 & -\frac{5}{2} \end{bmatrix}$$

$$A = \begin{bmatrix} \frac{3}{2} & 1 \\ \frac{1}{2} & \frac{5}{2} \end{bmatrix}$$

Problem

True or false? Justify your answer.

If $A^3 = 4I$, then A is invertible.

Solution

To show A is invertible, We need to find:

$$A \boxed{???} = \boxed{???} A = I.$$

Because $A^3 = 4I$, we see that

$$\frac{1}{4}A^3 = I$$

so

$$(\frac{1}{4}A^2)A = I \quad \text{and} \quad A(\frac{1}{4}A^2) = I.$$

Therefore, A is invertible, and $\boxed{???} = \frac{1}{4}A^2$, i.e., $A^{-1} = \frac{1}{4}A^2$.

Theorem (Inverse Theorem)

Let A be an $n\times n$ matrix, and let $\vec{x},\,\vec{b}$ be $n\times 1$ vectors. The following conditions are equivalent.

- 1. A is invertible.
- 2. The rank of A is n.
- 3. The reduced row echelon form of A is I_n.
- 4. $A\vec{x} = \vec{0}$ has only the trivial solution, $\vec{x} = \vec{0}$.
- 5. A can be transformed to I_n by elementary row operations.
- 6. The system $A\vec{x} = \vec{b}$ has a unique solution \vec{x} for any choice of \vec{b} .
- 7. The system $A\vec{x} = \vec{b}$ has at least one solution \vec{x} for any choice of \vec{b} .
- 8. There exists an $n\times n$ matrix C with the property that $CA=I_n.$
- 9. There exists an $n\times n$ matrix C with the property that $AC=I_n.$

Proof.

- (1), (2), (4), (5) and (6) are all equivalent.
- (6) \Rightarrow (7) is clear. As for (7) \Rightarrow (8), let \vec{c}_j be one of the solution of $A\vec{x}=\vec{e}_j.$ The

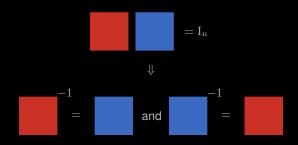

$$A[\vec{c}_1,\cdots,\vec{c}_n]=[\vec{e}_1,\cdots,\vec{e}_n]=I$$

Hence, (8) holds with $C = [\vec{c}_1, \dots, \vec{c}_n]$.

- $(1) \Rightarrow (8)$ and (9): Using $C = A^{-1}$.
- (8) \Rightarrow (4): Whenever \vec{x} is a sol. i.e., $A\vec{x} = \vec{0}$, then $\vec{x} = I\vec{x} = CA\vec{x} = C\vec{0} = \vec{0}$. Hence, $\vec{0}$ is the only solution. (4) holds true.
- $(9) \Rightarrow (1)$: By reversing the roles of A and C and apply (8) to see that C is invertible. Thus A is the inverse of C, and hence A is itself invertible.

Corollary

If A and B are $n \times n$ matrices such that AB = I, then BA = I. Furthermore, A and B are invertible, with $B = A^{-1}$ and $A = B^{-1}$.

Remark

Important Fact In Corollary, it is essential that the matrices be square.

Theorem If A and B are matrices such that AB = I and BA = I, then A and B are

square matrices (of the same size).

Example

Let
$$A = \begin{bmatrix} 1 & 1 & 0 \\ -1 & 4 & 1 \end{bmatrix}$$
 and $B = \begin{bmatrix} 1 & 0 \\ 0 & 0 \\ 1 & 1 \end{bmatrix}$. Then
$$AB = \begin{bmatrix} 1 & 1 & 0 \\ -1 & 4 & 1 \end{bmatrix} \begin{bmatrix} 1 & 0 \\ 0 & 0 \\ 1 & 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = I_2$$

and

$$\mathrm{BA} = \left[\begin{array}{ccc} 1 & 0 \\ 0 & 0 \\ 1 & 1 \end{array} \right] \left[\begin{array}{ccc} 1 & 1 & 0 \\ -1 & 4 & 1 \end{array} \right] = \left[\begin{array}{ccc} 1 & 1 & 0 \\ 0 & 0 & 0 \\ 0 & 5 & 1 \end{array} \right] \neq \mathrm{I}_3.$$

Remark

This example illustrates why "an inverse" of a non-square matrix doesn't make sense. If A is $m \times n$ and B is $n \times m$, where $m \neq n$, then even if AB = I, it will never be the case that BA = I.

Copyright

The Identity and Inverse Matrices

Finding the Inverse of a Matrix

Properties of the Inverse

Inverse of Transformations

Inverse of Transformations

Definition

Suppose $T: \mathbb{R}^n \to \mathbb{R}^n$ and $S: \mathbb{R}^n \to \mathbb{R}^n$ are transformations such that for each $\vec{x} \in \mathbb{R}^n$,

$$(S\circ T)(\vec{x})=\vec{x}\quad and\quad (T\circ S)(\vec{x})=\vec{x}.$$

Then T and S are invertible transformations; S is called an inverse of T, and T is called an inverse of S. (Geometrically, S reverses the action of T, and T reverses the action of S.)

Theorem

Let $T: \mathbb{R}^n \to \mathbb{R}^n$ be a matrix transformation induced by matrix A. Then we have:

- 1. A is invertible if and only if T has an inverse.
- In the case where T has an inverse, the inverse is unique and is denoted T⁻¹.
- 3. Furthermore, $T^{-1}: \mathbb{R}^n \to \mathbb{R}^n$ is induced by the matrix A^{-1} .

Fundamental Identities relating T and \mathbf{T}^{-1}

1.
$$T^{-1} \circ T = 1_{\mathbb{P}^n}$$

1.
$$T^{-1} \circ T = 1_{\mathbb{R}^n}$$

2. $T \circ T^{-1} = 1_{\mathbb{R}^n}$

Example

Let $T: \mathbb{R}^2 \to \mathbb{R}^2$ be a transformation given by

$$T\begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} x+y \\ y \end{bmatrix}$$

Then T is a linear transformation induced by $A = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix}$.

Notice that the matrix A is invertible. Therefore the transformation T has an inverse, T^{-1} , induced by

Example (continued)

Consider the action of T and T^{-1} :

$$T\begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} 1 & 1 \\ 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \end{bmatrix} = \begin{bmatrix} x+y \\ y \end{bmatrix};$$

$$\mathbf{T}^{-1} \left[\begin{array}{c} \mathbf{x} + \mathbf{y} \\ \mathbf{y} \end{array} \right] = \left[\begin{array}{cc} 1 & -1 \\ 0 & 1 \end{array} \right] \left[\begin{array}{c} \mathbf{x} + \mathbf{y} \\ \mathbf{y} \end{array} \right] = \left[\begin{array}{c} \mathbf{x} \\ \mathbf{y} \end{array} \right].$$

Therefore,

$$T^{-1}\left(T\begin{bmatrix} x \\ y \end{bmatrix}\right) = \begin{bmatrix} x \\ y \end{bmatrix}.$$
